

# WEB SPEECH API PROXY BALL

*Presented by: Andres M. Prieto*

# Overview

---

- *Concept*
- *Structure*
- *Proxy*
- *“NLP”*
- *Recognition*
- *Web speech API*
- *Living in web*
- *Some tips*

# Statistics

The following chart represents Barbara Blackburn (Best typist) vs Common non-competitive typist vs Common Speaker-Listening vs Handwriting

The background is a dark grey/black field with several abstract shapes. A large, light blue shape is in the top left corner. A large, dark blue circle is in the top right corner. A large, purple shape is in the bottom right corner. A large, dark grey shape is in the center.

# I HAVE THE BEST TALEN...

No, you don't

# Typers are humans

**Muscles are not iron**

**Best typers don't use QWERTY**

**Typing is exhausting**

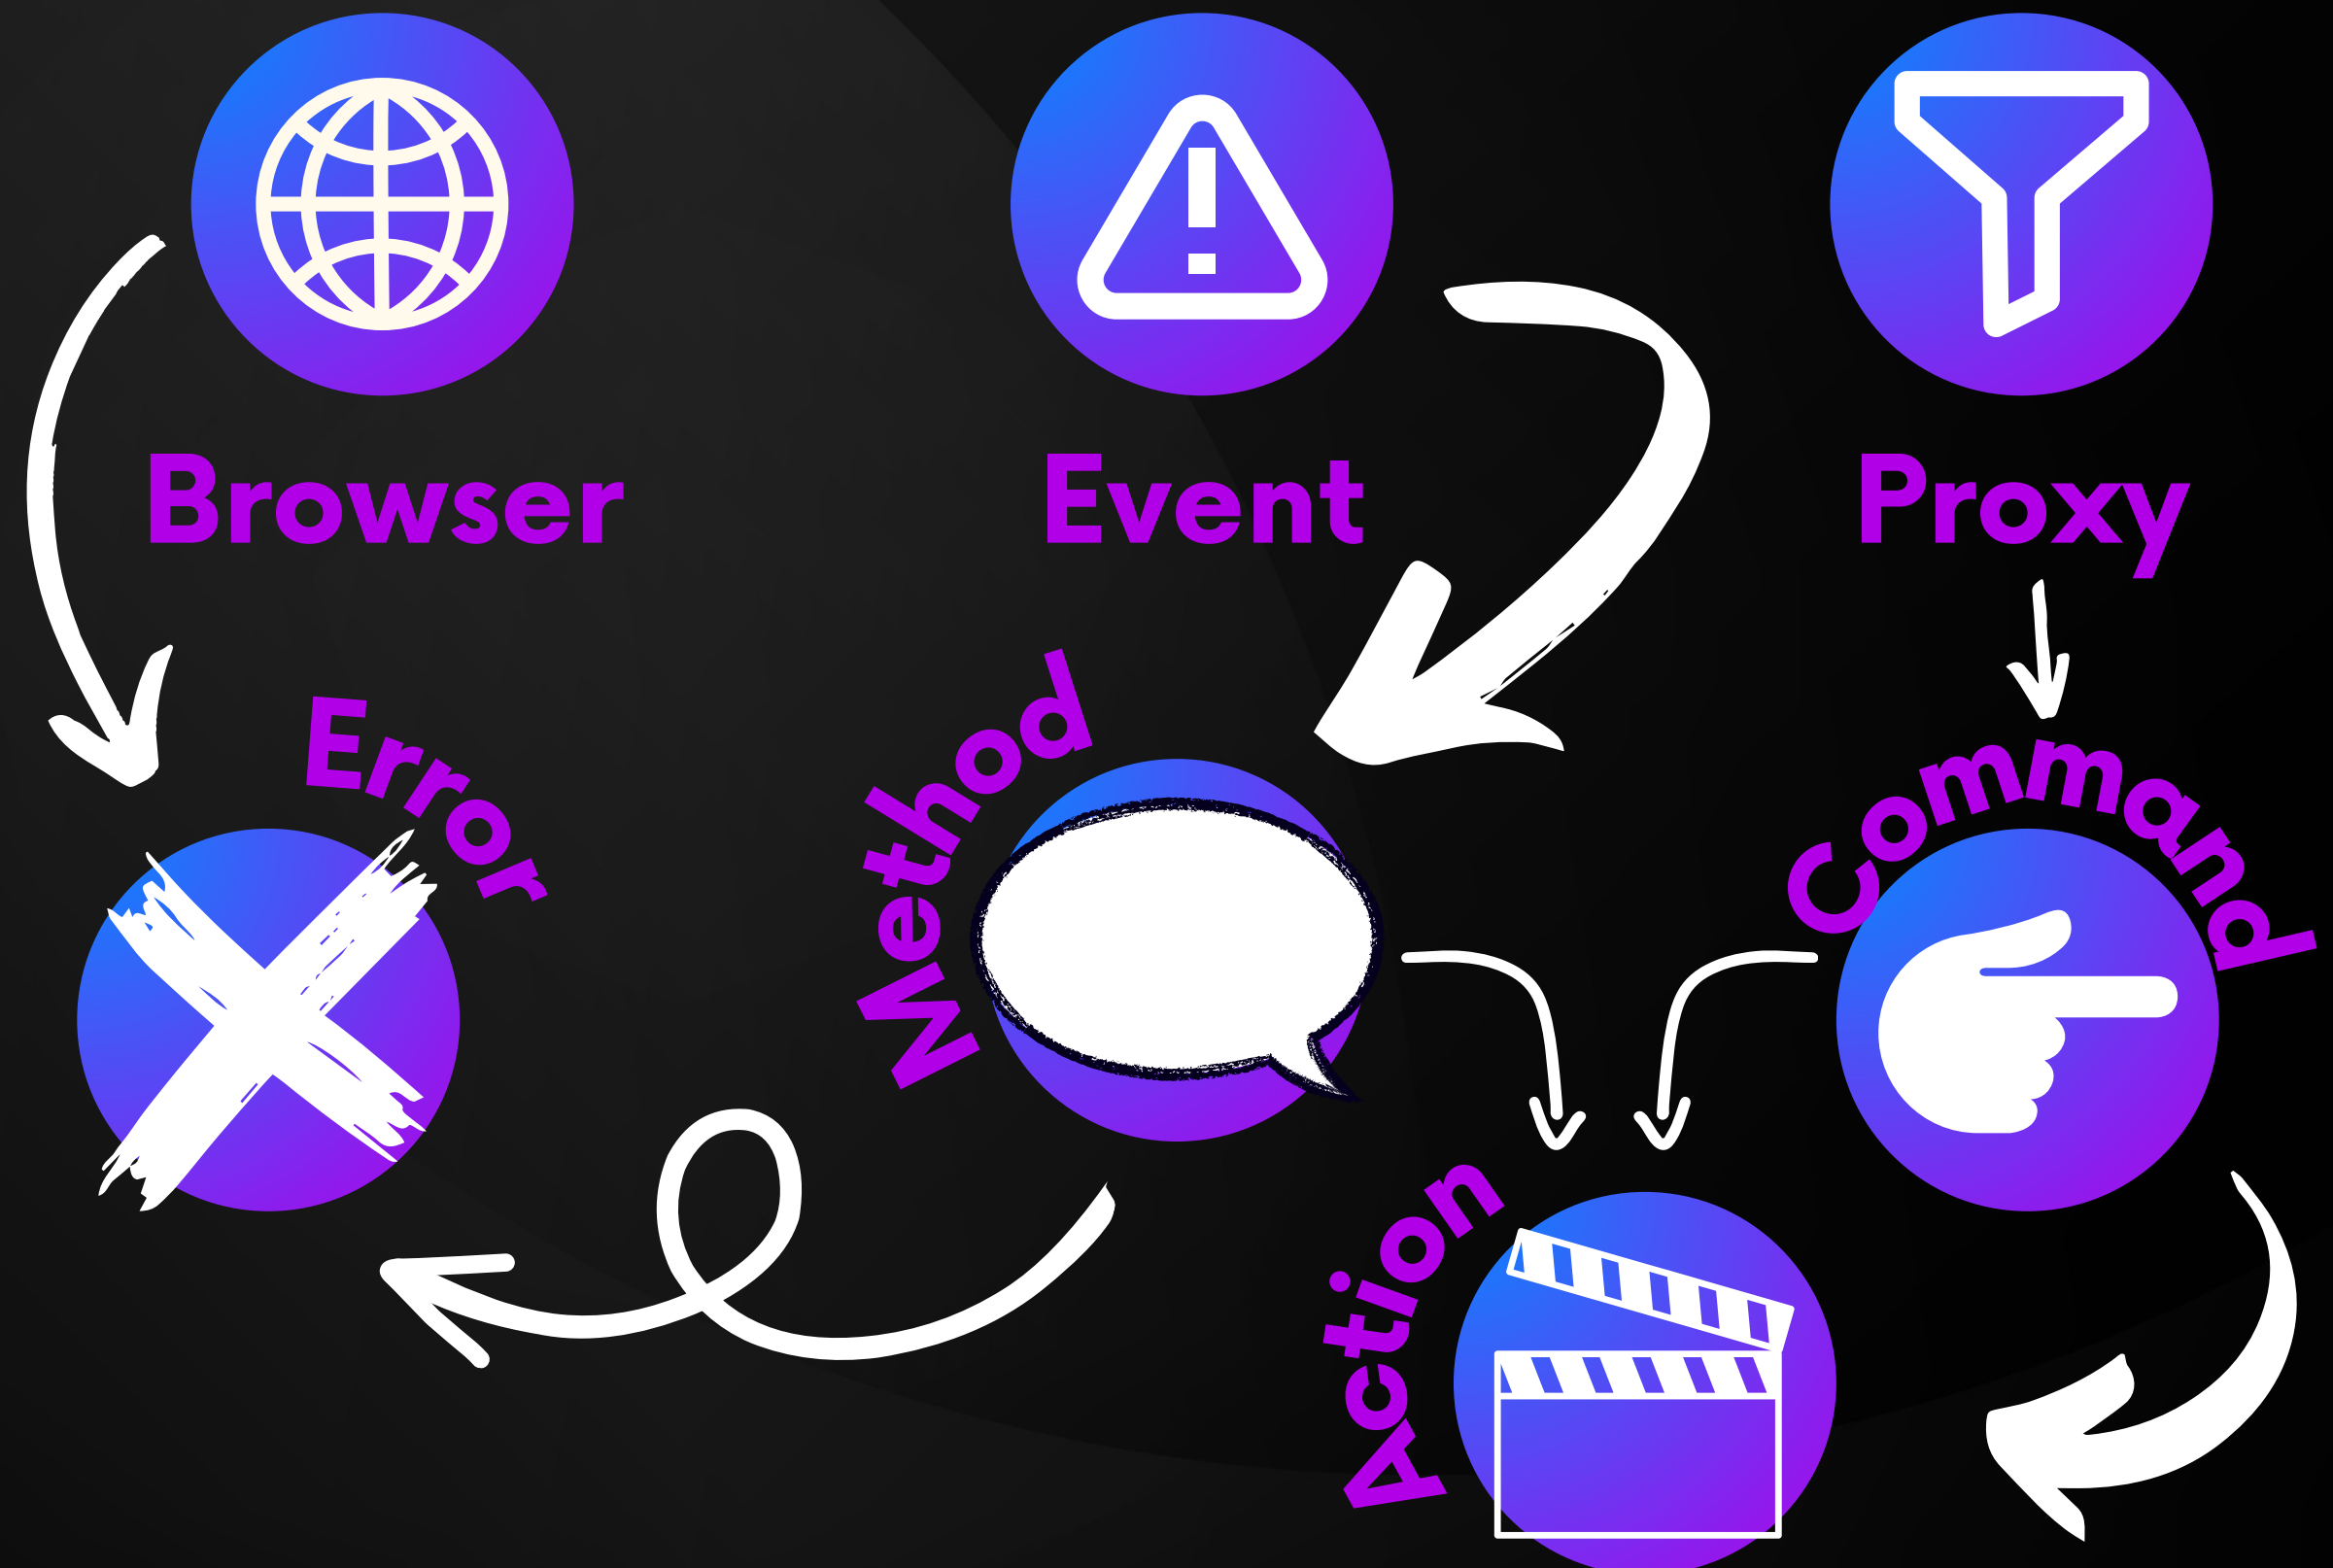

# STRUCTURE

Of proxy ball

## LET'S GO BY STEPS

# Definition

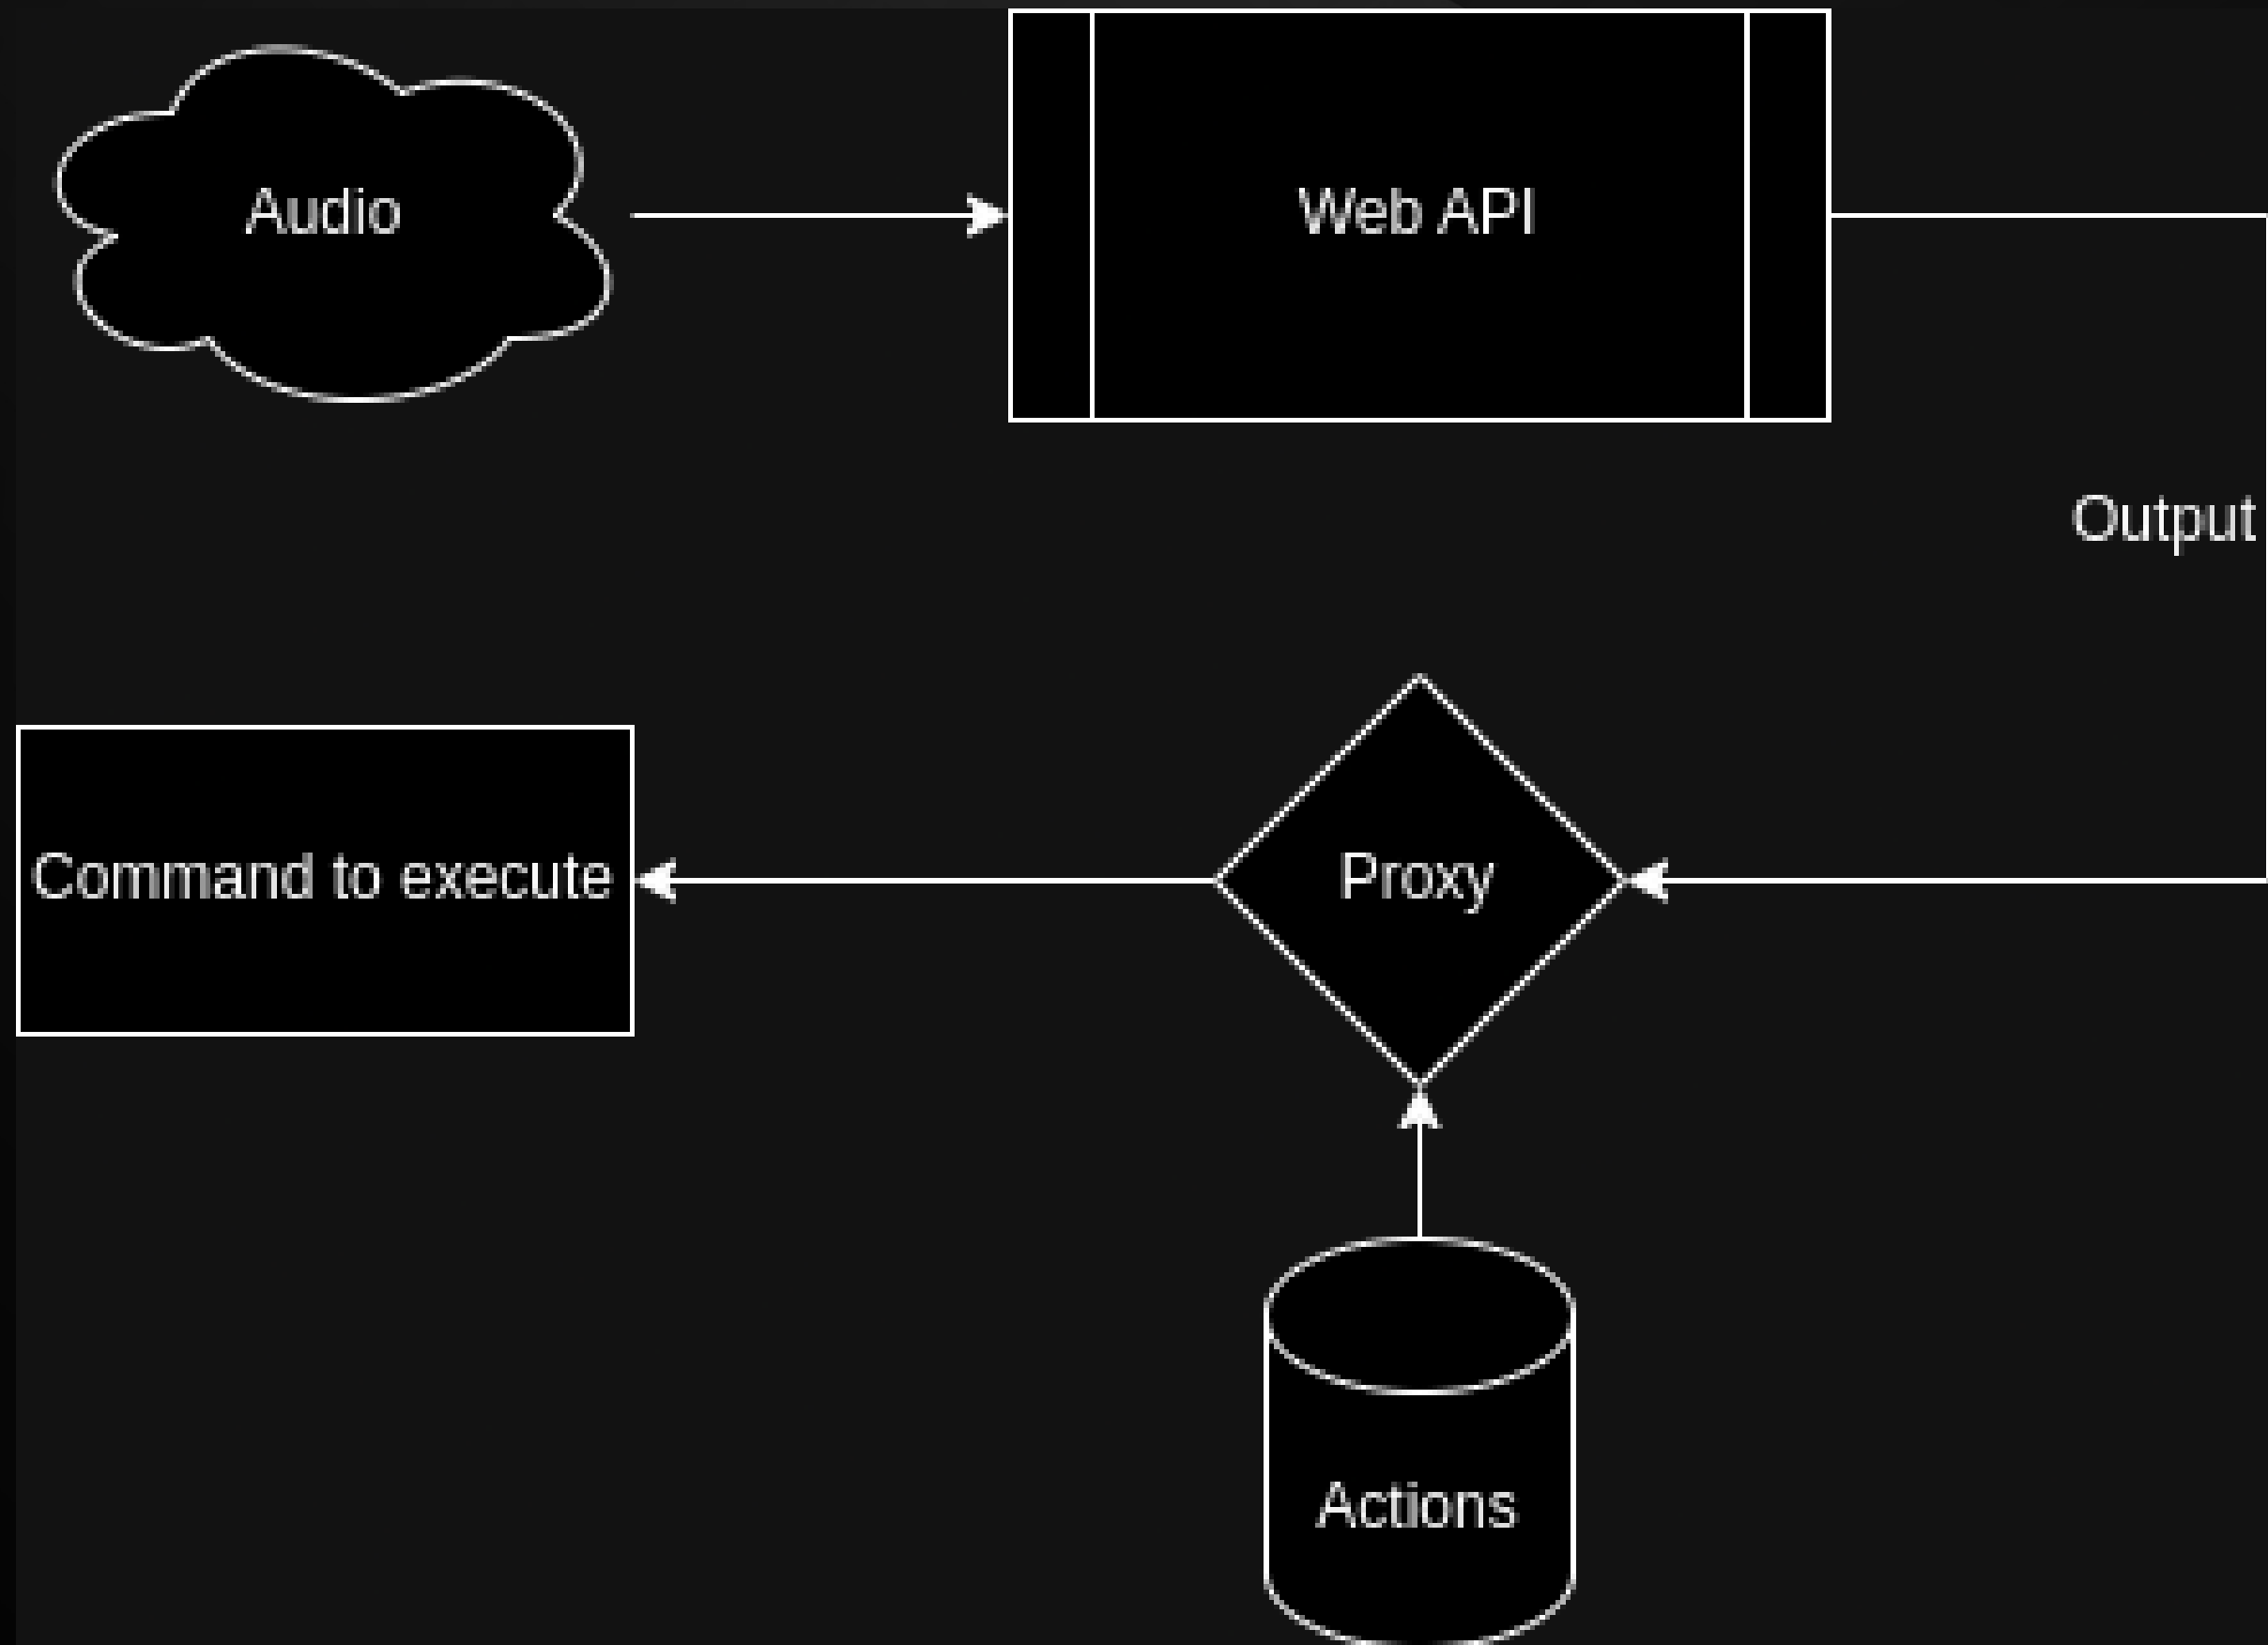

## Proxy

The `Proxy` object allows you to create an object that can be used in place of the original object, but which may redefine fundamental `object` operations like getting, setting, and defining properties. Proxy objects are commonly used to log property accesses, validate, format, or sanitize inputs, and so on.

# Proxy Arch

# Definition

## SpeechRecognition

The `SpeechRecognition` interface of the [Web Speech API](#) is the controller interface for the recognition service; this also handles the `SpeechRecognitionEvent` sent from the recognition service.

# What do you need to recognize?

01

# About

## Web Speech API

The **Web Speech API** enables you to incorporate voice data into web apps. The Web Speech API has two parts:

`SpeechSynthesis` (Text-to-Speech), and  
`SpeechRecognition` (Asynchronous Speech Recognition.)

# Benefits

Conf and play

Good enough

Low cost

Boostable

# THAT'S ALL THANK YOU
